

# Advanced Data Structures and Algorithms

*More dynamic programming!*

Longest Common Subsequences

Last time

# *Dynamic Programming!*

Tom Cruise programs dynamically  
in Mission Impossible

Last time

# *Dynamic Programming!*

- Not coding in an action movie.

# Last time

## *Dynamic Programming!*

- Dynamic programming is an **algorithm design paradigm**.
- Basic idea:
  - Identify **optimal sub-structure**
    - Optimum to the big problem is built out of optima of small sub-problems
  - Take advantage of **overlapping sub-problems**
    - Only solve each sub-problem once, then use it again and again
  - Keep track of the solutions to sub-problems in a table as you build to the final solution.

# Rest of Dynamic Programming

- Examples of dynamic programming:
  1. Longest common subsequence

# The goal of this lecture

# The goal of this lecture

- For you to get **really bored** of dynamic programming

- How similar are these two species?

# Longest Common Subsequence

- How similar are these two species?

DNA:

AGCCCTAAGGGCTACCTAGCTT

DNA:

GACAGCCTACAAGCGTTAGCTTG

# Longest Common Subsequence

- How similar are these two species?

DNA:

AGCCCTAAGGGCTACCTAGCTT

DNA:

GACAGCCTACAAGCGTTAGCTTG

- Pretty similar, their DNA has a long common subsequence:

AGCCTAAGCTTAGCTT

# Longest Common Subsequence

- Subsequence:
  - **BDFH** is a **subsequence** of **ABCDEFGH**

# Longest Common Subsequence

- Subsequence:
  - BDFH is a **subsequence** of ABCDEFGH
- If X and Y are sequences, a **common subsequence** is a sequence which is a subsequence of both.
  - BDFH is a **common subsequence** of ABCDEFGH and of ABDFGHI

# Longest Common Subsequence

- Subsequence:
  - **BDFH** is a **subsequence** of **ABCDEF<sub>H</sub>GH**
- If X and Y are sequences, a **common subsequence** is a sequence which is a subsequence of both.
  - **BDFH** is a **common subsequence** of **ABCDEF<sub>H</sub>GH** and of **AB<sub>D</sub>FG<sub>H</sub>HI**
- A **longest common subsequence**...
  - ...is a common subsequence that is longest.
  - The **longest common subsequence** of **ABCDEF<sub>H</sub>GH** and **AB<sub>D</sub>FG<sub>H</sub>HI** is **AB<sub>D</sub>FG<sub>H</sub>**.

# We sometimes want to find these

- Applications in **bioinformatics**

- The unix command **diff**

```

DN0a22a660:~ mary$
```

# Recipe for applying Dynamic Programming

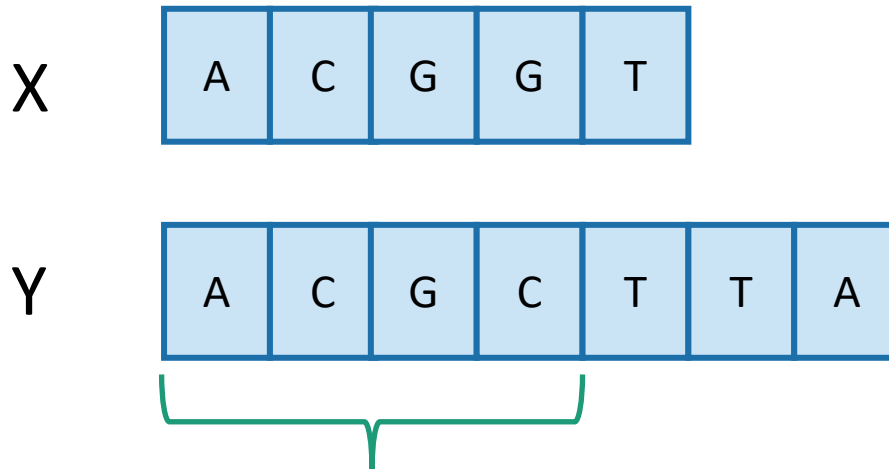

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the length of the longest common subsequence.
- **Step 3:** Use dynamic programming to find the length of the longest common subsequence.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual LCS.
- **Step 5:** If needed, code this up like a reasonable person.

# Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure. 
- **Step 2:** Find a recursive formulation for the length of the longest common subsequence.
- **Step 3:** Use dynamic programming to find the length of the longest common subsequence.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual LCS.
- **Step 5:** If needed, code this up like a reasonable person.

# Step 1: Optimal substructure

Prefixes:

**Notation:** denote this prefix **ACGC** by  $Y_4$

# Step 1: Optimal substructure

Prefixes:

**Notation:** denote this prefix **ACGC** by  $Y_4$

- Our sub-problems will be finding LCS's of prefixes to X and Y.
- Let  $C[i,j] = \text{length\_of\_LCS}(X_i, Y_j)$

Examples:  $C[2,3] = 2$   
 $C[4,4] = 3$

# Optimal substructure ctd.

- **Subproblem:**
  - finding LCS's of prefixes of X and Y.
- **Why is this a good choice?**
  - As we will see, there's some relationship between LCS's of prefixes and LCS's of the whole things.
  - These subproblems overlap a lot.

# Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the length of the longest common subsequence.
- **Step 3:** Use dynamic programming to find the length of the longest common subsequence.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual LCS.
- **Step 5:** If needed, code this up like a reasonable person.

# Goal

- Write  $C[i,j]$  in terms of the solutions to smaller sub-problems

$$C[i,j] = \text{length\_of\_LCS}( X_i, Y_j )$$

# Two cases

Case 1:  $X[i] = Y[j]$

- Our sub-problems will be finding LCS's of prefixes to X and Y.
- Let  $C[i,j] = \text{length\_of\_LCS}(X_i, Y_j)$

# Two cases

Case 1:  $X[i] = Y[j]$

- Our sub-problems will be finding LCS's of prefixes to X and Y.
- Let  $C[i,j] = \text{length\_of\_LCS}(X_i, Y_j)$

- Then  $C[i,j] = 1 + C[i-1,j-1]$ .
  - because  $\text{LCS}(X_i, Y_j) = \text{LCS}(X_{i-1}, Y_{j-1})$  followed by A

# Two cases

Case 2:  $X[i] \neq Y[j]$

- Our sub-problems will be finding LCS's of prefixes to X and Y.
- Let  $C[i,j] = \text{length\_of\_LCS}(X_i, Y_j)$

# Two cases

Case 2:  $X[i] \neq Y[j]$

- Our sub-problems will be finding LCS's of prefixes to X and Y.
- Let  $C[i,j] = \text{length\_of\_LCS}(X_i, Y_j)$

- Then  $C[i,j] = \max\{ C[i-1,j], C[i,j-1] \}$ .

# Two cases

Case 2:  $X[i] \neq Y[j]$

- Our sub-problems will be finding LCS's of prefixes to X and Y.
- Let  $C[i,j] = \text{length\_of\_LCS}(X_i, Y_j)$

- Then  $C[i,j] = \max\{ C[i-1,j], C[i,j-1] \}$ .
  - either  $\text{LCS}(X_i, Y_j) = \text{LCS}(X_{i-1}, Y_j)$  and  $T$  is not involved,
  - or  $\text{LCS}(X_i, Y_j) = \text{LCS}(X_i, Y_{j-1})$  and  $A$  is not involved,
  - (maybe both are not involved, that's covered by the "or").

# Recursive formulation of the optimal solution

- $$C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{C[i, j - 1], C[i - 1, j]\} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

# Recursive formulation of the optimal solution

$$\bullet \ C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{C[i, j - 1], C[i - 1, j]\} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

0	0	0	0	0
0	1	1	1	1
0	1	2	2	2
0	1	2	2	3
0	1	2	2	3
0	1	2	2	3

That 2 may as well  
have come from  
this other 2.

G

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

$$C[i,j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i-1,j-1] + 1 & \text{if } X[i] = Y[j] \text{ and } i,j > 0 \\ \max\{C[i,j-1], C[i-1,j]\} & \text{if } X[i] \neq Y[j] \text{ and } i,j > 0 \end{cases}$$

# Example

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

$$C[i,j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i-1,j-1] + 1 & \text{if } X[i] = Y[j] \text{ and } i,j > 0 \\ \max\{C[i,j-1], C[i-1,j]\} & \text{if } X[i] \neq Y[j] \text{ and } i,j > 0 \end{cases}$$

# Example

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

$$C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{C[i, j - 1], C[i - 1, j]\} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

# Example

- Once we've filled this in, we can work backwards.
- A diagonal jump means that we found an element of the LCS!

**This is the LCS!**

$$C[i, j] = \begin{cases} 0 & \text{if } i = 0 \text{ or } j = 0 \\ C[i - 1, j - 1] + 1 & \text{if } X[i] = Y[j] \text{ and } i, j > 0 \\ \max\{C[i, j - 1], C[i - 1, j]\} & \text{if } X[i] \neq Y[j] \text{ and } i, j > 0 \end{cases}$$

# Finding an LCS

- Takes time  $O(mn)$  to fill the table
- Takes time  $O(n + m)$  on top of that to recover the LCS
  - We walk up and left in an  $n$ -by- $m$  array
  - We can only do that for  $n + m$  steps.
- Altogether, we can find  $\text{LCS}(X,Y)$  in time  $O(mn)$ .

# Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the length of the longest common subsequence.
- **Step 3:** Use dynamic programming to find the length of the longest common subsequence.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual LCS.
- **Step 5:** If needed, code this up like a reasonable person.

This pseudocode actually isn't so bad

# This pseudocode actually isn't so bad

- If we are only interested in the length of the LCS we can do a bit better on space:
  - Since we go across the table one-row-at-a-time, we can only keep two rows if we want.
- If we want to recover the LCS, we need to keep the whole table.

# This pseudocode actually isn't so bad

- If we are only interested in the length of the LCS we can do a bit better on space:
  - Since we go across the table one-row-at-a-time, we can only keep two rows if we want.
- If we want to recover the LCS, we need to keep the whole table.
- Can we do better than  $O(mn)$  time?
  - A bit better.
    - By a log factor or so.

# This pseudocode actually isn't so bad

- If we are only interested in the length of the LCS we can do a bit better on space:
  - Since we go across the table one-row-at-a-time, we can only keep two rows if we want.
- If we want to recover the LCS, we need to keep the whole table.
- Can we do better than  $O(mn)$  time?
  - A bit better.
    - By a log factor or so.
  - But doing much better (polynomially better) is an open problem!
    - If you can do it let me know !!!!!

# What have we learned?

- We can find  $\text{LCS}(X,Y)$  in time  $O(nm)$ 
  - if  $|Y|=n$ ,  $|X|=m$
- We went through the steps of coming up with a dynamic programming algorithm.
  - We kept a 2-dimensional table, breaking down the problem by decrementing the length of  $X$  and  $Y$ .

# Recap

- We saw example of how to come up with dynamic programming algorithms.
  - Longest Common Subsequence
- There is a **recipe** for dynamic programming algorithms.

# Recipe for applying Dynamic Programming

- **Step 1:** Identify optimal substructure.
- **Step 2:** Find a recursive formulation for the value of the optimal solution.
- **Step 3:** Use dynamic programming to find the value of the optimal solution.
- **Step 4:** If needed, keep track of some additional info so that the algorithm from Step 3 can find the actual solution.
- **Step 5:** If needed, code this up like a reasonable person.

# Recap

- We saw example of how to come up with dynamic programming algorithms.
  - Longest Common Subsequence
- There is a **recipe** for dynamic programming algorithms.
- Sometimes coming up with the right substructure takes some creativity
